

CYNDRIEL, ALDEBARÁN – PART 2 - BIOLOGICAL DYNAMICS AND NATIVE POPULATION - EXO-PLANETS

Conocimiento Pleyadiano

March 21, 2021

Video URL: https://youtu.be/_t_qnhH-js0

In this second part, Anéeka of Temmer, an extraterrestrial woman from the star Taygeta in the Pleiades, describes the topography and climate of Cyndriel. Also the characteristics of the flora and fauna of the planet and how they are influenced by the powerful star Aldebaran. She also describes some species or families of animals that we do not have on Earth. And finally she tells us about the native population.

This video is the second in a series:

1/3 MYSTICAL PLANET

2/3 BIOLOGICAL DYNAMICS AND NATIVE POPULATION

3/3 TAYGETEAN BASE

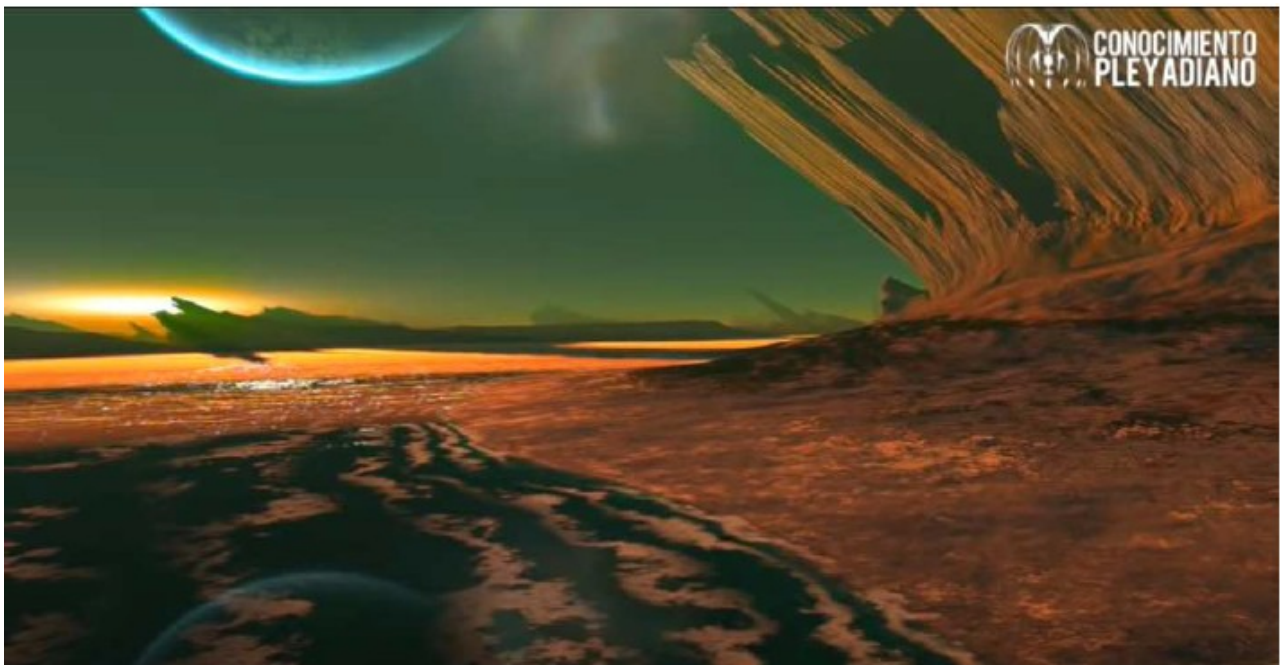

"This information is provided by extraterrestrial persons, women and men from the Taygeta star in the Pleiades cluster, through a written contact with us."

ANÉEKA OF TEMMER'S INFORMATION

As I was saying, everything there in Cyndriel is unfamiliar to you. Everything is huge. It gives you the feeling of being very small and insignificant. Everything is threatening, mostly because you don't know about it. Everything threatens you in Cyndriel. You see everything as dangerous. Each plant and each animal seems to be able to do something to you, with their exaggerated colors with many reds, yellows and oranges, as both on Taygeta and on Earth this indicates poison. The plants are strange, some transparent, also with red instead of green. All that dominates in plants are shades of red.

The stones and the mountains are huge and without slopes, like they are on top of you about to fall and just enormous. Here the sideways stones, as in this image, also dominate a lot in Cyndriel.

That feeling of uselessness, of being in constant danger, of not being able to hide from anything overwhelms you and at the same time Cyndriel's reality is that everything there is benign, everything is friendly, nothing hurts you. It is only your own mind, your ignorance the only thing that sees danger in everything. Nothing there can hurt you more than it is logical.

Also the time there is altered enormously, there being a huge difference in the perception of the passage of time on the surface than in the orbit. Time from a point of view like someone on the surface, let's say looking at plants and the landscape, feels the same as from the surface of any other planet or ship. But that is relative to each person as it is the person himself who is generating that perception of time. It is the reason why you feel or perceive the same. The problem is that, relative to another point, surface versus orbit, there can be a big difference that could only be reliably measured with two clocks.

TOPOGRAPHY AND CLIMATE

According to what I saw, I do not know if the whole planet is like that, it does not have a high density of plants, it is scarcer like a desert and almost the entire surface is rough in terms of topography with few plains, all high rocks. There's a lot of rock like that on Cyndriel, like in this picture. Rocks are like this from wind erosion.

The entire planet is desert due to the direct influence of radiation. There is a lot of wind too, abounding sandstorms and whirlwinds, which is why most of the planet's infrastructure in the form of cities and facilities is below the surface. The temperature is pleasant between 25 to 35 degrees Celsius on average, of course. Yes there are hotter and colder areas. For example, it can also be freezing from minus 80 degrees to over 50 degrees in desert areas at extreme points.

As I was saying, Cyndriel is surprising because everything there seems very hostile, but it is very benevolent. It seems like everything wants to kill or hurt you, when nothing logically can. Even spiny or spiky plants are very soft. They fall apart between the fingers. They don't hurt you.

So Cyndriel as a base or colony is a place, let's say, using human terms, it is a tourist place. Everybody wants to visit it, also for the mystical experiences it produces. The fact that there is no night does affect one so much so that the flora and fauna is very native, that is, it shares little with other places because it needs to be consistent with the fact that there are few cycles.

As I was saying, in Cyndriel there is only sun or shadow, never darkness. So, the organisms are specially for that place, adapted to not having night. The organisms there are characterized in that they need much less exposure to solar radiation than here or in Erra or Temmer. So they are not very sensitive because they have a lot of sun, that makes the photosynthesis processes slower

since the plant protects itself more from radiation than looking for said radiation as plants do on Earth. This gives the plants there their distinctive red or orange-yellow color contrasting to the green of Erra, Temmer, or Earth.

The animals are also adapted to a lot of sun with shells or very thick or scaly skin especially on the back, on top. And herbivores abound there because the plants are especially nutritious. For example, there are little lizards everywhere with scales on their backs and they are plant-eaters and eat tubers and seeds. There are no animals or plants that are also on other distant planets. That is to say, for example, in Erra there are rabbits and hares, the same as on Earth, but in Cyndriel there is nothing similar, that is why it is so exotic, and at the same time as it is not dangerous. It gives the experience of being on a planet very different from yours because in itself, Erra or Temmer looks a lot like Earth. Taken a photo they are confused among so many other similar super habitable planets. But not Cyndriel. It is unmistakably an alien world.

VEGETABLE KINGDOM

Red dominates in plants. It is photosynthesis red. It is curious because in itself, red and green are related as colors, that is why color blind people do not distinguish them, so it is only photosynthesis. Only that it adapted to red due to the influence of Aldebaran, since the influence of Aldebaran causes photosynthesis to be red, because it obeys specific frequencies where that wavelength is the most efficient for cellular processes.

The plants there are very pendulous like cactuses with long succulent leaves like razor clams, but transparent with a reddish hue with their sap ducts visible also in red like blood vessels. In Cyndriel a huge percentage of the plants are transparent or semitransparent like aloe leaves, but in red and without the shell only the transparent interior. That shape dominates in plants. The plants are somewhat similar to this image. Of this color inside. It only lacks the transparency, as if there were only a protective membrane on the outside.

What I have been told is that plants are like this because they have adapted to defend themselves from the excessive radiation of Aldebaran by adopting their transparent form so that the rays, the radiation, can pass through them and not stay in them. An adaptation to certain wavelengths of radiation from Aldebaran.

Radiation is transformed by planets. They are not inert. They do it with their own electromagnetic field, magnetosphere. And with its atmosphere, which, in turn, is altered and formed by the interaction of its living beings, be they plants or animals. Although the plants directly influence it more. Going into stranger things about Cyndriel, there is a kind of long-leaf cactus like what would be a Maguey plant, as it is known in Mexico, with that name, I don't know if there is another for the same plant, which grows from of a nucleus looks like this, but in red and orange colors with violet tips, but up and down equally and tends to float in the air at a low altitude, no more than 3 or 4 meters.

It is not from gas. It's because of some antigravity property that it has. I don't have the answer as to how or why, but they are found in clusters together and the wind moves them throughout the area. They throw spores in the lakes and there they grow floating. As they mature they come out of the water. What makes them float is something they have at their core. The one who would possibly know more about it is Yázhi Swarúu. It's one of the strangest things I've ever seen. Very similar to these images, but in red with violet tips and semi-transparent leaves.

ANIMAL KINGDOM

The animals in Cyndriel have very reddish to brown skin with scales like shields, but there are few animals on the surface. Animals generally seek the shade of large rocks. What dominates on Cyndriel when it comes to animals are small reptiles. It is the largest population. Small reptiles abound in the manner of iguana and lizards no larger than one meter. Reddish transparent again. Their internal organs look like some of the cave salamanders on Earth.

There are also amphibians. Compared to Taygeta where bird species are abundant, in Cyndriel they are almost completely absent. The birds are all orange for camouflage that makes them rare to observe. There is no species that is not orange or a variant of very uniform yellow or rust red. Regarding mammals, small mammals like rats abound. Long-legged with long faces like an anteater, they use them for the same thing since they are mainly insectivores. Few large animals. None the size of a cow or horse. Everything smaller.

There are also other species there that I don't know how to catalogue because they are neither reptiles nor mammals. Biologically they are related to plants. They look like big rodents, but they are plants. Very intelligent. Very mobile. Description: like a kind of porcupine with a crushed shell of scales that resembles a turtle, but without being rigid and that keeps eating algae and that green that covers the lakes. They are brown in color. About the size of a large house cat. They look more like animals. They don't look like plants per se, but their genetics are.

Its cellular structure is that of a vegetable. Their scaly skin, shell, produces photosynthesis like our skin produces vitamin D. They have veins with blood, but it is different. There it is like alien, green blood. They have nails, but no teeth. They have filters in their mouths like a duckbill that they use to filter solids from the water and eat that. And they have eyes, but they look black. Also, something similar to the races of grays. Also with a kind of sunglasses for the aggressive Aldebaran, although not as much as we would expect, as I have already said. That is, they have almond-shaped eyes and all black inside like with an extra layer of built-in sunglasses in addition to the eyelids.

Its molecular genetics, its organism and its metabolism are from plants, not animals. Just like the grays of Zeta Reticuli. They are plants. This is not entirely unknown since the grays, the gray aliens, those classics, of the 165 known species, more than half are plants as well. To the extent that the Americans, at the Wright Patterson base, where they brought the Roswell alien, named EBE-1, when he began to fall ill around 1955 and finally died, had to seek the help of botanical experts.

Going back to the Cyndriel animal species, there are also hybrid reptile-mammals that are actually neither. They suckle, but hatch from the egg like a dinosaur. Like a platypus, but flattened and larger than the size of a llama, but shaped like a camel with a beak. It is semi aquatic as a hippo would be. And in Cyndriel it means that it is semi underground since, as I have told you, it has many lakes, but most of them are in the shade or they would evaporate, since the surface is as porous as swiss cheese. That is to say, in the semi intraterrestrial hollows there are lakes and that is where life mostly thrives. Like in this image, but with multiple apertures.

This image does look like it.

But take into account that the mountain is porous made of pure rounded cavities with rounded pillars that support the structures above and the sun entering through the multiple cavities and below, lakes full of red plants and animals.

The lakes outside in the open are very salty, concentrated. Animals tend to avoid them, generally. But around there are plants of the Succulent Cactus type. All red. Some hybrids, reptilian mammals, look like dogs with scales and lizard faces. They look dangerous and they are fast and they make intimidating ugly sounds, but they do not hurt, they are herbivores. They lay eggs, but they suckle.

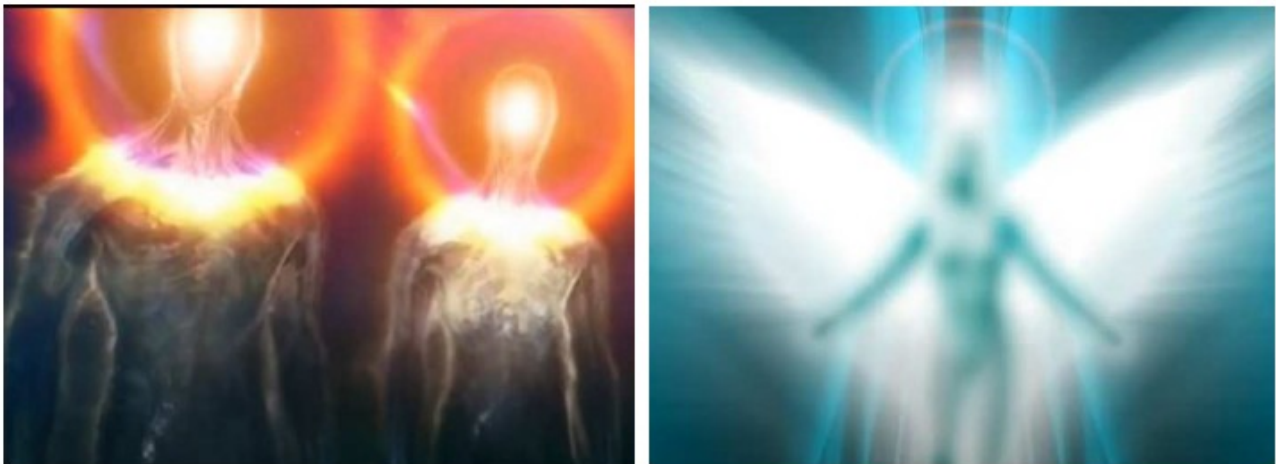

Needless to say, the platypus is not terrestrial. In the water there are also many species of invertebrate mollusks. In the water, below. Cousins of the octopus and squid, but from fresh water. Although, as I have said before, many lakes are salty. And there are also an uncountable variety of

flying insects. But something important to note here is that there are no species of plants or animals that Cyndriel shares with other planets. As shared by Alphrata, Erra, Temmer, Earth, Pitoya, among others. That is why it is a tourist destination, for the alien experience of being there. No common hare of the kind that abounds in so many places will cross you there. Everything you turn to see is unrecognizable and originates from there. Yes there are physical similarities, but they are not the same species. For example, plants mostly have leaves and animals mostly have four legs and one head. They seem to be universal constants, but that's where the similarities end. Although we could always classify them from something known like a species of mammal or egg-laying animal or succulent plant like cacti, but it would only be up to that point.

NATIVE POPULATION

Cyndriel has a native population. It has a number of energetic beings that inhabit 6D and above, 7D and higher. They are called Amélie. I don't know if that name is Navajo-based Taygetean. That name is used everywhere and by multiple races. I don't think it's Taygetean, Navajo, or Andromedan. I know it sounds familiar almost like "Amélie" in French, I know. Whether it is related or not, I don't know, but that name is very old and widely used.

These beings are rarely seen and were not even recognized as a civilization until recently because we have never seen them as a civilization, not as we understand it, they just are, as "Being" is enough for them. Do not speak. They are telepathic, only. They appear as beings of light in the mountains and in the caves when climbing or camping in high mountains in Cyndriel. It is not unusual to have an encounter with them.

They are humanoid in shape, but it's just like a haze of blue-white light. But we know that from those dimensions they can appear as whatever they want, as a human, as a dog, as a beetle. They are free and powerful to express themselves and to show themselves to you as they feel is best for them. This image is the typical representation of a being of light of high dimensions. They are usually shown in the most appropriate way for each person. That is, as expressed in the 1997 movie "Contact" with Jodie Foster, they can be portrayed as your deceased father or as someone who idolaters contact, or as a religious being, according to the consciousness of who sees them. That is, it looks like they transform, but they are only energy. They know. They know that everything is an illusion and they exploit it in the same way to have more influence on their contact. But they are always positive, transcendental, mystical.

I do not know if they feel invaded by tourists, I have asked myself the same thing, but they do not usually invade the entire planet. And you do hear from certain areas where one should not go, such as reservations. I don't think they like being invaded. But on the other hand, as they are of high densities, they are like in a parallel world where they are not touched. They leave us alone and we will Taygeteans leave them too.
